

Digital Microscope For Quality Analysis

Go Digital!

The Tagarno System is an efficient magnification tool for quality analysis and inspection of seed and grains.

Quickly perform processes such as:

- Film Coating Distribution
- Purity Determination
- Seed germination and capacity testing
- Variety identification
- Plug and Play to optimize process and save time
- Image capture at the click of a button

“Instead of sending seed samples around, we exchange images. It’s a lot quicker.”

Industry Feedback:

"We use the TAGARNO equipment for the evaluation of our seed treatment recipes. The TAGARNO device is really simple to use and requires no maintenance.

One of the best things about it is that it is so easy to take pictures. This has really improved our communication with our clients, internal as well as external ones."

"The sharp image provides a fast and clear view of the seed sample. At the same time, the device is really easy and fast to use.

With TAGARNO's digital microscope, we can perform twice as many analyses as before.

We save time"

"After we started using the digital microscope from TAGARNO our work positions are far more ergonomically correct.

As a result, we no longer suffer from neck and shoulder pains, which enables us to be far more efficient when performing identification processes."
